What's New in the?

CryptImage includes functions for encrypting and decrypting binary data (up to 32 bits) in an image and can be used to create very secure password-protected documents. CryptImage provides support for.MIF and.VIF images (E6Zip, UPX) and can be used to archive and compress any binary data, including plain or encrypted text, Pascal strings, encrypted images, etc. You can start by uploading a text file and click on the "CryptImage" icon above to encrypt it and a new image file will be created, named with the suffix "encrypted.tif". You can use this image to backup your original text file. You can easily decrypt the new image by using the function "CryptImage - Decrypt", which will extract the original text file. CryptImage can also be used to compress text files without even knowing the text's ASCII code (CryptImage can safely and securely store binary data encrypted and compressed with any popular algorithm, such as CCITT (telephone), the so-called "printable" ASCII code, or other schemes). If you wish to control the algorithm used for encryption, CryptImage allows you to specify up to four algorithms, using the functions "CryptImage.Rand(
