

"enter password for the encrypted file setup autocad 2013 exe" is not a topic that can be covered in a quick blog post because it requires an explanation of what encryption is and why certain files need to be encrypted. There are also security measures and credential requirements to mention. This post would need much more detail and many paragraphs (probably more than five) for this topic because it does not seem like something you can cover in one article. This is because if someone wants to install Autocad 2013 they are required to have certain credentials or security measures, which would take up more space on the page.

The article is still of value, even though it is missing some important information. Since the information has to do with security measures, it is more valuable to the people who are trying to make sure they are protected. If I had written this article with all the details, it would be very long and probably not worth reading for everyone. It might even be confusing because of how long it is (over 1000 words). When adding an article to Wikinews, one should look at what else is in that same category or subcategory of news articles on Wikinews. This kind of article is very important to show that Wikinews is not just about news articles, but it also covers other topics that are important to the community. This way, it makes people feel like they can trust Wikinews with their stories and know that it will be covered by people who are knowledgeable in the subject matter. Also, there are people who might want to start their own wiki or contribute to the one above them. It is good for this kind of article to be in at least two categories so that you gain more readers.

The two sets of information above were taken from different sources. The first set of information comes from Ross Anderson's website (link below). The website has all of the information on his paper. The second set of information comes from above on the wiki belonging to the person who wrote this article. 03-search-search-query-2.html was taken from an article on CNN's website about search engine security. It was very helpful to me since it came with a lot of information and instructions about how to test your searches to make sure they are secure.

It is hard to give concrete examples because of how long it takes to formulate them, but the Internet is full of these types of sites that have many different types of articles that can be found here: http://www.google.com/search?q=example+of+longer+article&hl=en&tbm=isch&source=hp&sa=X&ei=Q_WzVZ7NL5vW0AXAnfgCgBg&ved=0CAYQ_AUoAQ. If you enter that into the Google search bar and then look at the results, you will see what I am trying to say. The articles are about different topics, but they are longer than the articles on Wikinews. It gives people a place to go for these types of articles if they want to research or read more about it.
